

Cosmetic Image Clinics

Intense Pulsed Light (IPL)

Intense Pulsed Light (IPL) is used in Skin Rejuvenation, Pigmentation Reduction, Broken Capillaries Reduction and Hair Reduction.

IPL Photo-rejuvenation

IPL Photo-rejuvenation is a treatment for the face, neck and/or chest for redness and flushing of the skin. It reverses sun damage without disrupting the surface of the skin. It will improve skin tone and texture by subtly stimulating collagen production and reducing the appearance of fine lines. Enlarged pores, freckles, age spots and rosacea can be treated in the same session. Treatment packages often consist of 6 treatments and are done approximately 3 to 4 weeks apart.

IPL Hair Removal

For most people, the number of visits needed is between 3 and 6, since hair grows in phases and treatments are needed to match these cycles to ensure permanent results.
